

Fedora FedUp Does Not Sync Distribution

Finnbarr P. Murphy

(fpm@fpmurphy.com)

Fedora [FedUp](#) is an excellent tool for upgrading your Fedora system.

However you should be aware that it does not currently synchronize your system with the Fedora distribution that you upgraded to. To do that, you need to execute the following command after you finish FedUp-ing your system.

```
# yum distro-sync
```

From the *yum* man page:

```
distribution-synchronization or distro-sync
```

```
Synchronizes the installed package set with the latest packages available, this is done by either obsoleting, upgrading or downgrading as appropriate. This will "normally" do the same thing as the upgrade command however if you have the package F00 installed at version 4, and the latest available is only version 3, then this command will downgrade F00 to version 3.
```

```
This command does not perform operations on groups, local packages or negative selections.
```
