

Using FedUp to Upgrade an EFI Boot Stub System to Fedora 19

Finnbarr P. Murphy

(fpm@fpmurphy.com)

FedUp (FEDora UPgrader) is the new tool for upgrading existing Fedora installs in Fedora 18 and above releases. It replaces all the previously recommended upgrade methods, i.e. PreUpgrade, DVD, USB, etc., that were available in previous Fedora releases. By the way, the Anaconda installer was totally redesigned for Fedora 18 and no longer has built-in upgrade functionality in Fedora 18 or later releases. Such functionality was delegated to *FedUp*.

In this post, I demonstrate how to use FedUp to upgrade an EFI Boot Stub (*EFISTUB*) Fedora 18 system to an EFI Boot Stub Fedora 19 system. The [EFI Boot Stub](#) boot mechanism was first implemented in Linux kernel version 3.3.0 and provides for a significantly faster boot mechanism because a traditional EFI-aware bootloader, for example the Red Hat modified GRUB, GRUB2 and [Gummiboot](#), is no longer required on a [UEFI](#)-enabled system.

FedUp is capable of upgrading Fedora 17 installs to Fedora 18 (*Spherical Cow*) or Fedora 19 (*Schrödinger's Cat*), or Fedora 18 to Fedora 19 using a networked repository, similar to how PreUpgrade worked. This is the mechanism that I used. Other upgrade methods including an ISO file or DVD are supported but will not be discussed further in this post. You can find detailed information on all these methods in the FedUp Wiki.

Here is the EFI shell script which I used to boot Fedora 18 from the EFI shell prompt:

```
# cat /boot/efi/f18.nsh
vmlinuz-3.9.5-201.fc18.efi root=UUID=1d3092fc-265e-4860-a609-d6a16c1a6458 rd.lvm=0 rd.dm=0
KEYTABLE=us SYSFONT=True rd.md=0 rd.luks=0 ro LANG=en_US.UTF-8 rhgb quiet initrd=.\initr
amfs-3.9.5-201.fc18.x86_64.img
```

I assume that you are fairly familiar with the EFI shell and EFI shell scripts if you are reading this post so I make no attempt to explain how to create such a script.

FedUp consists of two components - a client which prepares the system for the upgrade and a pre-boot environment which does the actual system upgrade using [systemd](#) and [YUM](#). The FedUp client gathers the packages needed for upgrade in addition to downloading the required *initramfs* and kernel needed for the actual upgrade. Files are downloaded to */var/lib/fedora-upgrade*, and are deleted after the upgrade process completes. The actual upgrade occurs when the system has been rebooted after preparing the system for the upgrade. Filesystems are mounted during boot, the already downloaded packages are installed and some upgrade-related tasks are performed. During the upgrade process, a special [Plymouth](#) theme is used which has a progress bar to indicate current upgrade progress. The final phase is the cleanup and removal of unnecessary files and packages.

To upgrade a system, you must first install a FedUp package. The version installed on my system was *fedup-0.7.3-4.fc19.noarch*.

```
$ rpm -ql fedup
/etc/fedup
/etc/fedup/update.img.d
```

```

/usr/share/man/man8/fedup.8.gz

```

The contents of this RPM were not removed after the upgrade was completed.

Once you have installed the *Fedup* package, you can start the system upgrade using the following command:

```
#fedup-cli --network 19
```

You should check the `/var/log/fedup.log` file for any errors that occur in the preparation phase.

During the preparation stage of the upgrade the *FedUp* client installed the following three *Fedup*-related packages (and also numerous other packages). The *Dracut*-related files were installed on my system via the `fedup-dracut.x86_64 0:0.7.3-1.fc19` package.

```
$ rpm -ql fedup-dracut
/usr/lib/dracut/modules.d/85system-upgrade-fedora
/usr/lib/dracut/modules.d/85system-upgrade-fedora/do-upgrade.sh
/usr/lib/dracut/modules.d/85system-upgrade-fedora/keep-initramfs.sh
/usr/lib/dracut/modules.d/85system-upgrade-fedora/module-setup.sh
/usr/lib/dracut/modules.d/85system-upgrade-fedora/save-journal.sh
/usr/lib/dracut/modules.d/85system-upgrade-fedora/upgrade-cleanup.sh
/usr/lib/dracut/modules.d/90system-upgrade

/usr/share/plymouth/themes/fedup/throbber-029.png

```

The contents of this RPM were removed after the upgrade completed. You can see a demo of the Plymouth *FedUp* theme in action on my [YouTube](#) channel.

Once the first stage of the *FedUp* process has completed without major error, the second stage is invoked by rebooting your system. However do not reboot your system yet! Instead, as root, examine your `/boot/efi/EFI/redhat/grub.conf` file. It should contain a new menu stanza entitled “System Upgrade”. Take the contents of that stanza and create a new EFI shell script called `/boot/efi/upgrade.nsh` containing the appropriate EFISTUB command to invoke the special *FedUp* *initramfs* and kernel.

Here is what mine looked like:

```

# cat /boot/efi/fedup.nsh
vmlinuz-fedup.efi root=UUID=1d3092fc-265e-4860-a609-d6a16c1a6458 rd.lvm=0 rd.dm=0 KEYTABL
E=us SYSFONT=True rd.md=0 rd.luks=0 ro LANG=en_US.UTF-8 rhgb quiet upgrade systemd.unit=sy
stem-upgrade.target plymouth.splash=fedup selinux=0 initrd=.\initramfs-fedup.img

```

Note you will have to copy and rename both the *vmlinuz-fedup-** and the *initramfs-fedup-** images from `/boot` to `/boot/efi/`.

After this is done, shutdown your system and boot it from your EFI shell using *fedup.nsh*. The system should boot into the upgrade process and a Plymouth FedUp boot screen should be displayed. If you press the ESC key, a more detailed information about the progress of the update will be displayed. If you switch back to the graphical progress indicator, it will remain at 0% for the remainder of the upgrade but that does not mean the upgrade has stopped. This is a “feature” of the current version of FedUp. Another way to view the progress of the upgrade is to enable the upgrade debugshell by appending `rd.upgrade.debugshell` to the kernel command line and and invoke `journalctl -a -o cat`.

Once the upgrade is completed, the system will automatically reboot. This is where you need to interrupt the reboot sequence at the GRUB prompt and modify the GRUB stanza using the familiar kernel command line `init=/bin/bash` trick so that Fedora 19 boots into single user mode. You then need to create an EFI shell script (I called mine *f19.nsh*) and then, as before, copy/rename the appropriate kernel and *initramfs* images from `/boot` to `/boot/efi`.

Here is the contents of my *f19.nsh* shell script:

```

# cat /boot/efi/f19.nsh
vmlinuz-3.9.6-301.fc19.efi root=UUID=1d3092fc-265e-4860-a609-d6a16c1a6458 rd.lvm=0 rd.dm=0
KEYTABLE=us SYSFONT=True rd.md=0 rd.luks=0 ro LANG=en_US.UTF-8 rhgb quiet initrd=.\initr
amfs-3.9.6-301.fc19.x86_64.img

```

The upgrade journal is saved to `/var/log/upgrade.journal`, and also written to `/var/log/upgrade.log` for those who do not like the *systemd* journal approach.

Note the interesting character graphic at the end of the FedUp upgrade log!

I was successful in upgrading my system from an EFI Boot Stub Fedora 18 to an EFI Boot Stub Fedora 19 using *FedUp*. I encountered no problems whatsoever. I am sure that it would be fairly trivial to modify *FedUp* to automatically generate suitable EFI shell scripts.

Good luck with your own upgrade!
